Concrete degradation may have various causes. Concrete can be damaged by fire, aggregate expansion, sea water effects, bacterial corrosion, calcium leaching, physical damage and chemical damage (from carbonatation, chlorides, sulfates and non-distilled water). This process adversely affects concrete exposed to these damaging stimuli.

Alkali silica reaction is a durability issue of concrete that can widely observe in water retaining structures. Usually, these cracks appear after a long time of construction. The reaction occurs in the presence of alkali in the cement, reactive aggregate in the concrete, continuous availability of moisture and having heated up the required level.
